The Literature

I. The Principles of Literature Review (Uy, et al., 2017)

The purpose of the literature review is to give a general idea of what is known about the topic. It also tests the strengths of the evidences pertaining to the topic and it gives more weight and credibility. Normally, the review of literature contains a summary, a synthesis, or an analysis of the main avowals in the existing literature. The literature may come from journal articles, books, reports, and even working papers.The rule of thumb is; it is better to get literature from scholarly sources. If the literature came from a theory, it should have been written in the last 10 years. However, in practice, it is better if the literatures are written in the past five (5) years. There is no known rule regarding how much literature a researcher needs but most research advisers would suggest acquiring five (5) foreign literatures and five (5) local literatures. As such, these literatures should be relevant to the study. It does not necessarily mean that the literatures should agree with each other, as mentioned, the literatures should only give an overview of the topic and make the topic worth studying.

II. Organizing, Synthesizing, and Citing Related Literature

Since there are no known rules regarding how many literatures are needed for a research, having numerous literature could lead to replication of work and wastage of time. In order to address this dilemma, researchers usually employ the use of a summary table. A summary table lists and sorts out the literature gathered by a researcher. A summary table should contain eight (8) columns:

First column – contains the title of the book/journal, volume, issue number, and page number.
Second column – title of the article
Third column – name of the author or researcher
Fourth column – objectives of the paper
Fifth column – variables used in the study
Sixth column – locus or place of the study
Seventh column – method used in the study
Eight column – conclusions of the study

TITLE OF JOURNAL, VOLUME, ISSUE AND PAGE NO.	TITLE OF ARTICLES	NAME OF RESEARCHER	MAJOR OBJECTIVES OF THE PAPER	DELINEATED FACTORS	FOCUS OF THE STUDY	METHOD OF THE STUDY	FINDINGS OF THE PAPER
Journal of Management Inquiry, 2010, Vol. 19, p. 234	Commentary on "Appreciative Inquiry as a Shadow Process "	Bushe, Gervase R.	Provide a critique on Appreciative Inquiry and to decontextualize assertions of what is positive.	Appreciative Inquiry Organizational development Transformational change	Al teams	Action Planning Approach	Al becomes transformational as a change process.

Table 1. A Summary Table from the book Practical Research 2 by Uy, Cabauatan, De Castro, Grajo (2016)

Having a summary table makes literature gathering an ease. In synthesizing the literatures, on the other hand, we compare the findings of the literature, the variables employed and the methods used, and the objectives.

III. Ethical Standards in Creating the Review of Related Literature

The Intellectual Property Code of the Philippines or Republic Act 8293 specifically Part IV, Chapter 1, Section 171.7 is mandated to protect original works of performers, writers, artists, and other professionals from being illegally replicated. It is illegal to copy works without giving due credit to the original author. This law anchors itself to ethics and all researchers must observe proper conduct (Chan Robles and Associates Law Firm, n.d.). Citation, allows readers to know your original work from the study of others. In a way, you as a researcher, acknowledge and give respect to the original author of your chosen literature.

Plagiarism is one of the most common intellectual fraudulence in the realm of research. There are several types of plagiarism and in this handout; we will discuss a few common types researchers often stumble to.

Cut and Paste Plagiarism

A type of plagiarism where the researcher copies texts form a source word-per-word. One of the extreme cases of this type of plagiarism is when the researcher copies a passage or a whole document and attributes himself as the original author. If an author wishes to lift a text from a source, he or she must see to it that the original author is credited. The text should be enclosed in a quotation mark (“”). According to Clamor- Torneo and Torneo (2017), if the lifted text is a paragraph long, the researcher should indicate that the passage is an excerpt by separating the entire paragraph and enclosing it in quotation marks or indenting it by half-inch on each side. He or she must also indicate who the author of that particular passage was. For example:

> “Here the issues are a little more basic. The petitioners are not raising Sereno’s lack of judicial experience or the absence of any evidence of legal scholarship. Petitioners are merely pointing to the absence of key administrative requirements necessary for Sereno’s appointment as a magistrate. If the Court rules in favor of the petitioners, Sereno’s appointment to the tribunal will be deemed void from the onset.” (Magno, 2018, p. A6)

In the passage above, a newspaper article was lifted and used by the writer. It was enclosed in a quotation and proper acknowledgment was given. The original author as well as his article should be included in the reference list.

Mosaic Plagiarism

Mosaic plagiarism is a type of intellectual dishonesty that involves the copying of texts and altering a few words but still maintains the correct sentence or paragraph structure. It could still be classified as plagiarism even if the author/s are credited and cited. It reflects the weak paraphrasing ability of the researcher. Some researchers, in order to avoid this kind of plagiarism, would first read the material and then try to re-tell the passage on his or her own understanding. This would result in a significantly different writing than that of the original but still contain the same idea. The responsible researcher would then credit the original author.

Misattribution Plagiarism

This type of plagiarism happens when an excerpt or a literature material is used citing a different author or an erroneous source. There are two (2) type of misattribution plagiarism:

a. Accidental – this happens when there is careless or poor documentation on the part of the researcher.
b. Intentional – happens when the researcher is trying to hide something or is, most of the time, pressed for time.

In order to avoid this type of plagiarism, the researcher must always check his or her summary table.

Plagiarism is theft. Theft is a criminal offense by any standards, norms, laws and mores. However, there are remedies in order for us not to fall prey of committing plagiarism. One of the solution is properly citing our sources in the reference section or bibliography of our study. Normally here in the Philippines, we use the APA citation style. APA stands for American Psychological Association. It was first published in 1929 as a group of

selected by-laws done by scholars whose mastery is in academic writing (Clamor-Torneo & Torneo, 2017). In using the APA format in in-text citations, the author's surname followed by the year the article was published should be indicated. For example: (Espiritu, 2016). However, if there are multiple authors, all their surnames must be first mentioned in the citation. For example: (Espiritu, James, Irvin, Harden, Korver, 2017). Subsequent citations from the same authors need only one name from the group followed by the term *et al*. Et al means others in Latin. For example: (Espiritu, et al., 2017)

It is also acceptable to mention the name of the authors in the text and only enclosing the year the article was published. For example:

> "According to Espiritu, James, Irvin, Harden, and Korver's study entitled: The Psychological Impact of *Ankle Breakers* to Opposing Team's Overall Team game (2017), ankle breakers could alter and lower the morale of an opposing team. This is due primarily from embarrassment and humiliation since professional basketball games are publicly broadcasted on national television."

We must also understand that there are ways of citing different sources using the APA. But the advent of technology made it simpler for researchers to properly cite their sources. The Microsoft Word application has a built-in feature for citation. Books, journal articles and even videos can be cited using this feature. Also, there are websites that teaches proper citation in APA on different types of sources.

**See 03 Supplementary Material 1 on how to use the MS Word citation feature.*

IV. Formulating the Theoretical and Conceptual Framework

One thing that sets social and scientific research apart from other types is that it relies heavily on the use of theory. Theory is used as a foundation for formulating research questions, hypothesis, and the procedure on how to collect data. In this section, we will differentiate theoretical framework to conceptual framework.

Theoretical Framework versus Conceptual Framework

The theoretical framework acts a lens to guide the researchers in identifying the variables and the relationships they have. Theories formulated can be found in this section. Also, this part links the theory, the conceptual definitions, terms adopted in the study, and the relevant literature the researcher has gathered (Uy, et al., 2017). The theoretical framework explains the theories in such a way that it will be more understandable on the part of the reader and it lets them know the and understand evidenced-based facts (Baraceros, 2016. On the other hand, conceptual framework enables the readers of the research to see the basic form of the study. It differs slightly to theoretical framework because it solely relies on a single theory. It is commonly used when there is no theory that fits or sufficiently explains the matter being studied. Conceptual frameworks are often made by the researcher or is adopted by the researcher from other studies. It can be developed by knowing the key concepts and try to logically explain an occurrence or phenomena (Clamor-Torneo & Torneo, 2017).

Ways of Presenting a Theoretical of Conceptual Framework

There are a few ways on how to present a theoretical or conceptual framework. Below are some of the common ways in writing a framework:

1. **Diagram –** Diagrams provide visuals, which show interconnections and relationships between variables and the different elements of a study. If the study deals with causal relationships and models involving several variables. It helps the readers see a clear picture of how these relationships intertwine.

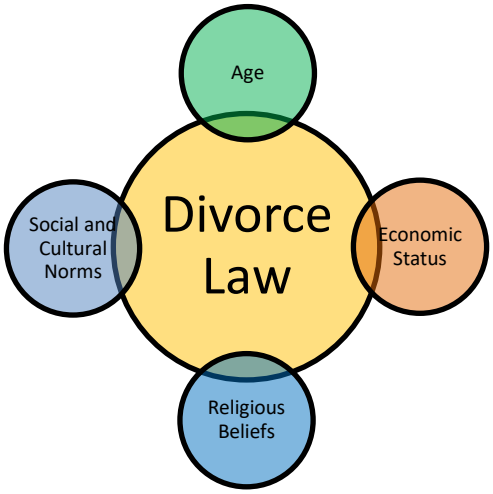

Figure 1. The diagram depicts the relationship of four (4) variables in enacting a divorce law. Politicians may consider these variables before formulating a mandate pertaining to such a sensitive issue.

2. **Narrative –** In a narrative type of writing a conceptual or theoretical framework, usually the researcher summarizes the assumptions of a study, which is anchored in a theory, or sets of theory. This type of writing is used when there is a direct relationship between variables.

   Example:
   The assumption of minute entities could alter the course of a much bigger ones relies on the Chaos Theory which stresses that unexpected things could alter other factors somewhere else. Also, basing the assumptions from an American mathematician Edward Norton Larenz and Mary Cartwright's theory of Butterfly Effect which they made a study entitled "Deterministic Non-periodic Flow" (1963), this study, examining the effects of minute objects, hypothesizing that small objects and their properties could alter factors someplace else. As the butterfly theory suggests: a butterfly flapping its wings in Nevada could cause a tornado in Wichita, Kansas.

3. **Sets of Propositions –** In this type of research framework, researchers present their framework via interconnected hypotheses.

   Example:
   Hypothesis: The enactment of a divorce decree in the Philippines will:
   1. Positively give protection to the aggrieved spouse.
   2. Positively decrease the incidents of violence against women and children.
   3. Positively help people with lower economic status and has an already failing marriage to dissolve their marital relationship legally without the burden of paying heavy court and lawyer fees.
   4. Positively prove that the provision in the Philippine constitution, specifically Article II, Section 6, the separation of church and state, stands ground.
