Research

- It is taken from the word "re", which means *again*; and "search," meaning *to investigate* (Bargo, 2014).
- It is derived from the Middle French "*recerche*" or "the act of searching closely."

I. Research Methods

A. Quantitative Method

- Explains phenomena by collecting numerical data analyzed using appropriate statistical treatment.
- It emphasizes objective measurements and the statistical, mathematical, or numerical analysis of data collected through polls, questionnaires, and surveys, or by manipulating pre-existing statistical data using computational techniques. (Babbie, 2010).

B. Qualitative Method

- Obtains a more holistic picture of what goes on in a particular situation or setting.
- It stresses the socially constructed nature of reality, the intimate relationship between the researcher and what is studied, and the situational constraints that shape inquiry (Norman & Lincoln, 2000).
- It reveals a target audience's range of behavior and the perceptions that drive it with reference to specific topics or issues. It uses in-depth studies of small groups of people to guide and support the construction of hypotheses. The results of qualitative research are descriptive rather than predictive.
- Qualitative research methods originated in the social and behavioral sciences: sociology, anthropology, and psychology. Today, qualitative methods in the field of marketing research include in-depth interviews with individuals, group discussions (from two [2] to 10 participants is typical); diary and journal exercises; and in-context observations. Sessions may be conducted in person, by telephone, via video conferencing, and via the Internet.

II. Research proposal

- an academic work that aims to persuade people that the researchers have the integral skills and work plan to complete a research

A. At the start, researchers should be able to tap into the following queries:
   - In writing the proposal, what do I aspire to achieve?
   - Why do I want to achieve such goals?
   - How will I do it?

B. <u>Characteristics of a Good Research Proposal</u>
   Proposals should consistently be coherent, unified, and enthralling. A good research proposal should:
   - direct a problem, issue, or concern;
   - deliver firsthand information that will aid in solving the problem;
   - assume a methodology suited in resolving the research question; and

- be sure to accomplish a determined time frame.

Researchers should avoid topics that are too broad, too technical, too constrained in resource materials, and too time-consuming.

C. Different sections in the research proposal

1. Introduction

a. Research Problem

- is a universal statement that ensures the rudiments of research. Articulating a research problem entails a criterion as stated by Catane in 2000. They are encapsulated as follows:
  - It should express a relationship between two (2) or more variables.
  - It should be stated clearly and unambiguously, usually in question form.
  - Is should be feasible to carry out such operations or activities.
- Research questions that should **NOT** be considered are:
  - Ethical questions
    Do children conceived out of Vitro fertilization perform better in class that those conceived naturally?
  - Yes or no questions
    Do male students resort to utilizing the Edmodo application to complete their assignments?
  - Abstract questions
    Is same-sex marriage an abomination of faith?

b. Statement of the Problem

- It pertains to the ***purposefulness of the study***. It answers the questions, what does your study intend to prove or explore? Why is there a need to do so? In other words, it is the central point of your research.
  - Tips for writing a statement of the problem:
    1. Wording should be concise and distinctly written.
    2. Problems should be clearly identified by providing a short summary of your study.
    3. Persuasive arguments could be shown as to why the research is of value.
    4. Bits and pieces of the review of related literature could be presented to illustrate how the research applies to different sectors of the society.

c. Significance of the study

- It is a critical part of the research since the researcher aims to influence the readers into reading the study. It simply answers the following questions:
  - Why is it essential to investigate? What are its implications?
  - Can it be connected to other branches of knowledge? How?
  - How will it bring about change in altering our misconceptions of the world? Will this benefit decisions done by policy makers?
  - What new perspectives could be attributed to the completion of the study?
  - Once completed, how will this aid breakthrough in this field, and in other fields as well?

d. Hypothesis

- It is a ***scholarly assumption, designed to define, analyze, and expound a fact or an instinctual phenomenon***. Catane in 2000 (as cited by Kerlinger, 1972:18, Tuckman, 1972:24) listed its characteristics:
  - It is a conceptual statement of the relation between two (2) or more variables.
  - They are always in declarative sentence form, and they relate, whether generally or specifically; variables to variables.
  - They can carry clear implications for testing the stated relations.
- While discussing hypothesis, the word *variable* is encountered. Keyton (2011) simply defines it as an element that is specifically identified in the research hypothesis or questions. One's age, social strata, gender, religion, sexual preference, political belief, educational attainment, IQ – all can be considered a variable since they can alter and diversify the concepts mentioned, and can eventually be measured and proven.
  - There are two (2) main types of variables:
    1. *Independent variable*
       The variable that is stable and unaffected by the other variables you are trying to measure. It refers to the condition of an experiment that is systematically manipulated by the investigator. It is the ***presumed cause***.
    2. *Dependent variable*
       The variable that depends on other factors that are measured. These variables are expected to change as a result of an experimental manipulation of the independent variable or variables. It is the ***presumed effect***.

e. Definition of terminologies

- ***Unlocks words*** or expressions crucial in understanding the veracity of your study

2. Literature review

- The literature review frames the entire research analysis. It presents a ***summary of all the pieces of literature obtained and reviewed by the researcher***, facilitating the crafting and expansion of the study.
- An effective literature review is able to affirm the relationship between past studies with present ones, and should address established assumptions that could be of helpful or detrimental to the current study.
- *Books, academic journals, newspapers, government publications, conference* presentations, and the World Wide Web are the nest sources for creating your literature.
  - *Documenting the study*
    It is the heart of the literature review section – giving credit for every borrowed idea you use on your paper, which also establishes validity of evidence borrowed (Escandor & Dapat, 2014). There are two (2) documenting styles that researchers avail and adopt:

I. *American Psychological Association (APA) format*

In citing the references using this format, simply follow the guidelines listed:

a. First word should be alphabetized; wherein the second line is indented.
b. There is no need to write the first and middle names, initials will do.
c. For book and article titles, the first word of the title, the word succeeded by a dash or colon, and all proper nouns, are capitalized.
d. Titles of books and periodicals should be italicized, and principal terminologies in periodicals capitalized.
e. Referenced works in the paper's text will be listed down, except for personal communication.

3. Methodology
   - Refers to the defining and designing of strategies in conducting the study, for the purpose if addressing the research problem. There are two (2) primary designs in research – the *quantitative* and *qualitative* approach.
   - The differences of quantitative and qualitative approach by Leedy and Ormrod (2010):

Questions	Quantitative	Qualitative
What is the purpose of the research?	• To explain and predict • To confirm and validate • To test theory	• To describe and explain • To explore and interpret • To build theory
What is the nature of the research process?	• Focused • Known variables • Established guidelines • Predetermined methods • Somewhat context-free • Detached view	• Holistic • Unknown variables • Fixed guidelines • Context-bound • Personal view
What are the data like, and how are they collected?	• Numeric data • Representative, large sample • Standardized instruments	• Textual and/or image-based data • Informative, small sample • Loosely structured or non-standardized observations and interviews.
How are the data analyzed to determine their meaning?	• Statistical analysis • Stress on objectivity • Deductive reasoning	• Search for themes and categories • Acknowledgment that analysis is subjective and potentially biased • Inductive reasoning
How are findings communicated?	• Numbers • Statistics, aggregated data • Formal voice, scientific style	• Words • Narratives, individual quotes • Personal voice, literary style

4. Results and Discussion
   - It contains the presentation of the results in a non-text format, such as tables, graphs, or charts. Always label non-text forms so your readers can understand these figures. There should be a paragraph or two (2) that will interpret each of the forms; remember not to repeat what is already obvious when looking at the figures.

- Below is a sample of a presentation of *Results and Discussion*:

Question: Please tell me how satisfied or dissatisfied you are in the performance of Benigno Aquino III as President of the Philippines. Are you very satisfied, somewhat satisfied, undecided if satisfied or dissatisfied, somewhat dissatisfied, very dissatisfied?

SOCIAL WEATHER STATIONS 30years Statistics

Third Quarter 2015 Social Weather Report

September 2-5, 2015 National Survey

The Third Quarter 2015 Social Weather Survey, conducted from September 2-5, 2015, found 64% satisfied, 14% undecided, and 22% dissatisfied with President Benigno "Noynoy" Aquino III's performance.

Compared to June 2015, gross satisfaction with Pres. Aquino rose by 7 points from 57%, gross undecided fell by 1 point from 15%, and gross dissatisfaction fell by 5 points from 27% [*Chart 1, Tables 1 and 2*].

This brings Pres. Aquino's latest net satisfaction rating up to +41 (% *satisfied* minus % *dissatisfied*), classified by SWS as "good". This is 11 points above the "good" +30 in June 2015, and the highest since +45 in March 2014.

5. Conclusions and Recommendations
    - This part summarizes what your research was able to uncover, what the findings suggest, and offer ways on what future research can do to improve on if they want to do something similar to your study.

D. Evaluation of a Research Report Outline

These are the questions that should be asked in evaluating the research report:

1. Is the problem clearly stated?
2. Is the significance recognized?
3. Are specific questions raised?
4. Are there enough previous studies reviewed?
5. Is the review of the previous studies organized?
6. Is there adequate and clear description of the project?
7. Are data gathering instruments appropriate?
8. Is/Are statistical treatment/s appropriate?
